

ABSTRACT

A digital camera (1) according to the present invention includes an external memory device (12) to store image data, a communication device (15) connected to LAN to conduct a data communication, and a
5 control section (10) to control these. The control section (10) sends request data to the LAN with a broad cast by the external memory device (12), and when data for responding to the request data are received from a device connected to the LAN, the control section detects an IP address of the equipment in which the response data are sent,
10 and the control section (10) sends the image data stored in the external memory device (12) to the equipment which includes the detected IP address.
